

## CMS driven Websites

Spiderace provides most user-friendly content management solutions that fits your purpose and your knowledge level and future expansion plans be it your internet/intranet/extranet websites. We will implement the CMS for you, then configure it and finally customise any code/write plugins when required to arrive with those features that satisfy your requirement and alas, you will be availed with an easy to use admin panel & a WYSIWYG Editor with which you can start taking pace in presenting your inputs (content of the website) in the fullest capacity of the Content Management System (CMS).

Some of the main advantages of having a CMS system in your website were:

- You can virtually manage 100's of pages of content in the same centralised CMS system.
- Easy to use intuitive interface
- Extremely configurable, current generation CMS systems are with many features which you can use to control placements of different blocks of content on different pages all at your project prototype.
- Scalable as you grow (suitable for enterprise use)
- Search Engine Friendly URL's is an advantage
- Ultimate user experience

We had huge experience working with all industry standard GPL licensed CMS systems (from their 1st generation to 4th generation) like PHPNuke, PostNuke, Mambo, Joomla, Drupal, and many other CMS systems.

Some of the features include:

Posting & Editing Options for Static Content

Scheduling Content Display Options

You might have content that is useful or valid on a particular day and when you like to present content of such sort in your website, CMS's Content Scheduling feature helps you to set a date interval between which that particular content can be displayed on your website and taken off soon after the time is up. This feature helps you to have a clean/updated website without any clutter waiting for you to remove/disable manually off the screen.

Components & Modules

Additional features, customisation of an existing feature can be done in the name of adding components (which are complete software that gets integrated) while modules are dependent and those handy features used by core CMS as well as the previously defined Components also. Technically speaking, we can integrate any software into CMS be it an external integration or in deep integral inline integration methods (sometimes complete code rewrite of the concept is required for it to work as component of the CMS under work. The type of features that can be added as components were Shopping carts, image galleries, discussion forums, backup tools, document management, archiving tools, and

many more that come in aid in the frontend as well as backend of the CMS management on your website.

You can post content like articles, latest news, case studies, standard documents etc any kind of static content easily in the appropriate sections. Every CMS software is now equipped with browser based WYSIWYG (What You See Is What You Get) Editor which helps you write in it's interface or switch to HTML Interface to manually write the content with HTML codes altogether.

You can directly Copy n Paste the content (you had a formatted copy of in your favourite offline document writer software like Microsoft Word/Open Office Writer etc), into the WYSIWYG Editor's design interface. There were enough tools for you to add pictures and other multimedia objects in your content as well.

### Multiple User Levels

It will have multiple user level system which gives added control in a multiple site administrator environment. Permissions can be applied so that a manager can access upto certain levels and site administrator can do more and that way. This approach helps the site management define roles and the system is modular enough to allow the users perform according to their allowed limits.

### Other Options

They include File Manager, Image Manager, File Archiver, Post Archiver, Link Manager, Template Manager, Caching option and many more.....

Feeling interested to have your favourite CMS implemented or you need to know more about what suits your requirement, then contact our Sales Team to get your questions clarified and a proposal made for your upcoming new/to be redesigned website project.
